United States

Hi,

Please accept this letter as part of my application for a position on your team as a Software Engineer at Formlabs.

I am a self-starting and driven person, who can offer you an entirely self-taught software development background. In my current role, I've initiated and delivered multiple full stack python web applications with complete autonomy. The latest, "Richard", will be most representative of where my skill-set is today. Additionally, I have nearly four years of experience working with computational geometry and solid mechanics, optimizing structures of some of the world's most complex architecture. In summation, I believe my skills and abilities could set me up to become an invaluable asset to your team.

I'm specifically interested in opportunities where I can work within a team, whom with I share a common vision, and develop a technology product. I have no doubt that working alongside the technical talent at Formlabs would afford me the opportunity to challenge myself and deepen my software development knowledge. To be frank, there are multiple roles of those you've advertised, which I find exciting. I'm comfortable wearing a lot of hats and don't pay much mind to titles. Should you believe I might add more value in an adjacent position, I am very open-minded and would be eager to learn more.

My resume, linkedin profile, and personal website are included in my application. I hope that these media provide you with sufficient detail for an initial understanding of my background. I would like to share a link or source code for any of my work, but the intellectual property is that of my current company. I live in Boston and should you be available to meet in person, I can be prepared to speak to my code in detail. I very much appreciate you taking the time to consider me for a position on your team. I hope we speak soon.

Respectfully,

Thomas Shouler
