United States

Hi,

Please accept this letter as part of my application for a position on your team as a Software Engineer and Civil Engineer at Intersection.

I am a self-starting and driven person, who can offer you an entirely self-taught software development background in addition to nearly 4 years experience as a structural engineer optimizing some of the world's most complex architecture. In my current role, I've initiated and delivered multiple full stack python web applications with complete autonomy. The latest, "Richard", will be most representative of where my skill-set is today. It is adopted and relied upon by multiple project teams within my company to deliver structural engineering services for a \$10B, 6,000,000 sq-ft airport terminal.

I'm specifically interested in opportunities where I can work within a team, whom with I share a common vision, and develop a technology product. I have no doubt that working alongside the technical talent at Intersection would afford me the opportunity to challenge myself and deepen my software development knowledge. With that though, I believe I could also add considerable value as a Civil Engineer on your team. I don't pay much mind titles and am very comfortable wearing a lot of hats. If you are interested, I would be eager to discuss how best my background and abilities might map onto your team.

My resume, linkedin profile, and personal website are included in my application. I would like to share a link or source code for any of my work, but the intellectual property is that of my current company. Should you be interested in taking next steps, I can live demo my work and speak to my code in detail. I very much appreciate you taking the time to consider me for a position on your team. I hope we speak soon.

Respectfully,

Thomas Shouler
